

Roy Panduro is a Mechanical Engineer from the National University of Engineering (UNI), Peru, and holds an M.Sc. in Engineering and Materials Science from the Pontifical Catholic University of Peru. He is currently a PhD candidate in Sciences of Engineering at Université Paris-Est Créteil (UPEC), France, where his research focuses on the sustainability and numerical modeling of photovoltaic systems. He has experience in research and university teaching in computational mechanics, numerical methods, finite element analysis, computational fluid dynamics, and thermo-mechanical modeling, as well as in the design and simulation of engineering systems. He is the author and co-author of several scientific publications in indexed journals covering composite materials, viscoelasticity, biomechanics, and computational modeling. His current research integrates numerical simulation, heat transfer, and energy analysis for the study and optimization of photovoltaic technologies and solar energy systems, with particular interest in their performance under different climatic conditions and in the development of sustainable energy solutions.

Paper title: Steady-State Analytical Modeling and Parametric Analysis of a Water-Cooled Photovoltaic–Thermal Module

Paper ID: 439
